To my wonderful parents, Albert and Sharon Reece

for their infinite love, encouragement, and support
ACKNOWLEDGEMENTS

I would first like to express my deepest gratitude to my thesis advisor, Dr. Brian Wadzinski, for his continuous support, guidance, and patience. I always felt that he truly wanted me to succeed in my PhD, and I am very grateful for all of the time that he invested in my development as a scientist. I am also very grateful for the efforts and advice of my thesis committee: Dr. Bih-Hwa Shieh, Dr. George Hill, Dr. Roger Chalkley, and Dr. Joey Barnett. Their helpful suggestions and scientific contributions were invaluable. In addition, I would like to thank Dr. Lee Limbird who gave important and sage advice to me about my project. I would also like to especially thank Dr. Lou DeFelice, who always encouraged me and believed in me. To all the members of the Wadzinski laboratory, I will always be thankful for your friendship and support during my graduate years. In particular, I would like to recognize Matt Mazalouskas who I collaborated with on several of the studies found in Chapter II. I am very fortunate to have developed friendships with several wonderful people during graduate school, who provided me with laughter and emotional support, and truly made my days brighter.

Nobody has been more important to me in the pursuit of this degree than the members of my family. My sisters, Brynne and Sharon-Andrea, have become more than just sisters to me – they are my best friends as well. Words cannot express the gratitude that I feel towards my parents, Albert and Sharon Reece, for their constant prayers on my behalf, their inexhaustible encouragement of my spirits, and their unfailing confidence in my abilities.

Lastly, this work would not have been possible without the financial support of the Vanderbilt Training Grant 2-T32-GM07628 and NIGMS Predoctoral Fellowship
which were awarded to me, and NIH Grants GM051366 and 354DK070787 which were awarded to my advisor, Dr. Brian Wadzinski.

## Chapter

### I. INTRODUCTION .............................................................................................................. 1

Regulation of Cellular Signaling by the Reversible Phosphorylation of Proteins ................................................................. 1
Serine/Threonine Phosphatases .......................................................................................................................... 2
Overview of PP2A ........................................................................................................................................... 5
Elucidating the Biological Functions of PP2A ................................................................................................. 11
Regulation of PP2A ........................................................................................................................................ 13
Defining Cellular Substrates for PP2A ........................................................................................................... 15
Ca²⁺/Calmodulin-Dependent Protein Kinase IV ............................................................................................. 18
CaMKIV Activation/Inactivation ...................................................................................................................... 22
CaMKIV Function ........................................................................................................................................ 26
The Role of PP2A in CaMKIV Signaling ...................................................................................................... 28
Summary .................................................................................................................................................. 30

### II. DIFFERENTIAL REGULATION OF ENDOGENOUS AND ECTOPIC CAMKIV PHOSPHORYLATION BY PP2A ........................................................................................................... 32

Introduction .............................................................................................................................................. 32

Materials and Methods ............................................................................................................................. 34
Antibodies and Reagents ............................................................................................................................. 34
Cell Culture and Transfection ..................................................................................................................... 35
Subcellular Fractionation .............................................................................................................................. 36
Immunofluorescence and Confocal Microscopy .......................................................................................... 36
Coimmunoprecipitations ............................................................................................................................ 37
Characterization of CaMKIV Phospho-Specific Antibodies ...................................................................... 38
Analysis of CaMKIV T200 Phosphorylation ............................................................................................. 40
Western Analysis .................................................................................................................................... 41
Results .................................................................................................................. 42
Charaterization of Two CaMKIV Phospho-T200-Specific Antibodies ..........42
The Phosphorylation of Endogenous and Ectopic CaMKIV is
Differentially Regulated by PP2A ................................................................. 48
Subcellular Localization of Ectopic and Endogenous CaMKIV ............... 51
Endogenous, but not Ectopic CaMKIV, Binds to PP2Ac ......................... 53

Discussion ........................................................................................................... 56

III. THE REGULATORY B SUBUNITS OF PP2A ARE CRITICAL
MODULATORS OF THE CaMKIV•PP2A SIGNALING COMPLEX .............. 61

Introduction ......................................................................................................... 61

Materials and Methods .................................................................................. 63
Antibodies and Reagents ................................................................................. 63
Plasmid Constructs .......................................................................................... 64
Cell Culture and Transfection ........................................................................ 65
RNAi-Mediated Knockdown of Bα ................................................................. 65
Coimmunoprecipitations ................................................................................ 66
Purification of FLAG-Tagged Proteins .......................................................... 67
Preparation of Phosphorylated Substrates and Phosphatase Assays ........ 68
In Vitro CaMKIV Dephosphorylation Assays .............................................. 68
Western Analysis .............................................................................................. 69

Results ............................................................................................................... 70
Bα- and Bδ-Containing PP2A Holoenzymes Associate with CaMKIV ....... 70
The B subunits Recruit PP2Ac to CaMKIV...................................................... 73
ABαC- and ABδC-Mediated Dephosphorylation of CaMKIV ...................... 76
Multiple B subunit-Containing Holoenzymes Dephosphorylate CaMKIV .... 78

Discussion ........................................................................................................... 83

IV. SUMMARY AND FUTURE DIRECTIONS ...................................................... 87

Summary ............................................................................................................ 87

Future Studies .................................................................................................. 90
Does the Reconstituted CaMKIV•PP2A Complex Mimic the
Endogenous Complex? ................................................................................... 90
Does the Regulatory B subunit Remain Stably Associated
with CaMKIV? .................................................................................................. 92
What is the Oligomeric Composition of the CaMKIV•PP2A Signaling
Complex? ......................................................................................................... 93
Which Region of the B Subunit(s) Contains the Binding Domain
for CaMKIV ....................................................................................................... 95
LITERATURE CITED .................................................................................................................. 97
